Probably related is the fact that now a source RTE HTML like:

```
<table align="left" border="2" cellpadding="10" cellspacing="10" style="width:100%">
```

is transformed in

```
<table style="width:100%">
```

Practically all obsolete <table> attributes are removed but those are still settable (therefore usable by the editor) in CKEditor.

Is this markup directly produced in CKEditor, or is it generated/processed in some Fluid template, processor or whatsoever?

```
<table align="left" border="2" cellpadding="10" cellspacing="10" style="width:100%">
```

is produced in a CKEditor field in the BE and saved into the DB without alterations.

The table attributes are removed in the FE. I didn't debug where exactly but it's for sure processed by Fluid.
