[TASK] Get rid of inline JavaScript in new content element wizard

This patch cleans up the NewContentElementController, used for the "new content element wizard". All inline JavaScript is removed, in favour of a custom web component and an improved JavaScript module, handling the two modes (create content with known colPos and create content while selecting the desired colPos).

Previously, the wizard was triggered by a t3js-* class. Since e.g. the fluid based page module related templates might be overridden in extension code, a fallback layer is present to still support this way of initialization in v11.

Due to the necessary refactoring, some related bugs are fixed:

- Accessing the wizard via the context menu now works correctly
- The "saveAndClose" feature is now also respected in case the user has to choose the desired colPos
- Using a custom wizard endpoint (mod.newContentElementWizard.override) does no longer initialize the TYPO3 related JavaScript, which previously led to a JavaScript TypeError
- A duplicated clear "icon" in the elements filter is removed

[BUGFIX] Fix list style of new content element wizard button

The "new record" view uses the bootstrap list-group component. Except for the first group item, all items get their border-top removed. This however did no longer work for the "new content element wizard" item, since it's "wrapped" into a web component since #95277.

This is now fixed by manually removing the border-top from the list group item, using bootstrap API classes.

Revision 8d3e14ed - 2021-10-08 16:31 - Marcel Schüßler

[TASK] Ensure record_commit parameters are not reused

When using the "saveAndClose" option for a newContentElementWizard item, the target link forwards directly to the record_commit route instead of FormEngine. Previously the parameters for this link were added to an array, which was then never reset after used for the link creation. This therefore resulted in multiple elements were created as soon as the "saveAndClose" option was set multiple times.

This is now fixed by not using a single use variable anymore, but directly building the data array in the link, like it's already done for the FormEngine links.

[!!!][TASK] Remove fallback for triggering new content element wizard

The new content element wizard was reimplemented as web component in #95277.

Triggering the wizard using a HTML class was kept for backwards compatibility reasons, but is now removed.
