Task # 26658 (New): Make Form ViewHelpers consistent

Binding to nested arrays impossible for form-elements

2010-09-27 23:57 - Christian Opitz

Target version:			
Has patch:			
Description			
<p>I want to bind my form to an array with variable nested arrays. I already extended form and set the formName to ---ignore--- to trigger the objectAccessor-Mode - works so far. Now all names are generated perfectly but there is a useless check in <code>getPropertyValue()</code> that makes it impossible to get a value of sth. like</p>			
<pre><fh:form object="{gp}" fieldNamePrefix="gp"> <f:textfield property="bla.blubb"/> </form> <!-- Which renders to: --> <form...> <input type="text" name="gp[bla][blubb]"/> </form></pre>			
<p>The value can not be detected because there is a check for array in AbstractFormFieldViewHelper on line 152.</p>			
<p>As far as i can see this check is useless as the <code>Tx_Extbase_Reflection_ObjectAccess::getPropertyPath(\$formObject, \$propertyName);</code> can handle arrays too. So i would be very happy, if you could remove it :)</p>
